Practical No.: 9

Name: More Vaishnavi Dadaso

Roll No.: 269

Problem Statement: Given: l A text string text of length n. l A pattern string pattern of length m. Objective: Find all starting indices i in the text such that the substring text[i:i+m] is exactly equal to the pattern, using the Native String Matching Algorithm approach. Constraints: l 0 ≤ m ≤ n. Characters in text and pattern can be any valid characters (e.g., a–z, A–Z, digits, etc.)

Code:

```
# Naive String Matching Algorithm

text = input("Enter Text: ")

pattern = input("Enter Pattern: ")

text = text.lower()

pattern = pattern.lower()

n = len(text)

m = len(pattern)

found = False

print("\nPattern found at index:")

for i in range(n - m + 1):
```

```
    if text[i:i + m] == pattern:
        print(i)
        found = True

if not found:
    print("Pattern not found")
```

Output:

Enter Text: Vaishnavi

Enter Pattern: shn

Pattern found at index:

3
